---	-----------	----

INTRODUCTION

This pamphlet is one of a series of reports on the geology and hydrology of Aurora County, South Dakota. It is designed to aid in the exploration and development of sand and gravel resources within the County. The purpose of the report is two-fold: (1) to disseminate information about sand and gravel as rapidly as possible, and (2) to express the technical data in a non-technical manner that will be useful to the lay reader.

Other upcoming reports include "Major Aquifers in Aurora and Jerauld Counties, South Dakota," "Water Resources of Aurora and Jerauld Counties, South Dakota," and "Geology of Aurora and Jerauld Counties, South Dakota."

The first report describes the yield, quality, and location of major aquifers (water-bearing deposits) in a short, easy to read pamphlet. The second and third reports are more technical and exhaustive investigations of the hydrology and geology of the Counties.

In addition, it is recommended that the following publication be used as a companion reference to this pamphlet:

Evaluation of exploration methods for coarse aggregate in eastern South Dakota: South Dakota Geological Survey Report of Investigations 96

GEOLOGIC TERMS

The following brief discussion of geologic terms is presented as an aid in understanding the discussion of sand and gravel deposits.

Outwash

Glacial outwash is a general term referring to any deposit of clay, silt, sand, gravel, or boulders that has been washed and sorted, and subsequently deposited by water from melting glacier ice. Depending on the amount of sorting action, the material may contain an abundance of silt and clay, or in the other extreme, outwash may consist primarily of boulders. Most outwash is a mixture of material between the two extremes. In other words, an outwash deposit is usually composed of sand and gravel.

Till

Till is the term used for the unsorted and unstratified material lodged beneath a glacier or let down by a glacier as the ice melted away. The mixture for the most part has not been subjected to the action of running water and therefore is a mixture of clay and silt containing a random mixture of sand,

gravel, and boulders. The material is locally called "boulder clay" or "blue clay."

Distribution of till at the surface is extensive throughout Aurora County. However, within large areas of till there may exist small isolated hills or lenses of outwash material. The size of these hills or lenses may range from a very small knob or patch as small as 100 square feet to an area covering several acres or several tens of acres. Thickness of the sand and gravel in the knobs or lenses may vary from a thin veneer to 50 feet, but generally the thickness is less than 20 feet. In some cases, the larger and thicker isolated knobs and lenses of outwash may contain useable sand and gravel.

As a result of the complexities in the mechanics of deposition from the ice, these small hills and lenses of outwash have a very random occurrence. Their presence cannot generally be determined unless the outwash material is exposed or unless its presence has been determined through use of hand auger holes, test holes, or other sampling procedures.

Alluvium

Alluvium consists of a mixture of clay, silt, sand, and gravel that has been deposited by streams since the retreat of the glaciers. The grain size of the deposits will depend primarily on the velocity of the stream and may vary from place to place in the stream valley. Where deposits consist primarily of sand and gravel they may be mined for construction materials.

Bedrock Deposits

Bedrock deposits refer to the consolidated rocks underlying the glacial deposits. In Aurora County, the bedrock deposits are sedimentary and consist primarily of shale and chalk. No possibility exists of finding sand and gravel where the bedrock is present at the surface. However, sand and gravel deposits may occur in contact with bedrock along some drainage ways.

EXPLANATION OF TABLES

Table 1 is a list of test holes drilled in Aurora County along with their locations. Water levels are included where known. Most have been drilled by the South Dakota Geological Survey. Other test hole logs have been supplied by private drillers, the Office of Water Rights, the United States Water and Power Resource Services, and the United States Geological Survey. Only that part of the log which indicates sand and/or gravel has been included in order to reduce the amount of extraneous information.

Table 2 is a list of sand and gravel pits on file with the South Dakota Department of Transportation,

Division of Highways. Where the information is available it also includes the type of material it contains, the average thickness of overburden, and the average thickness of sand and/or gravel being removed. The depths of some pits are determined by the water table and others by the predominance of medium to fine sand or clay.

EXPLANATION OF MAP

The map shows locations of test holes, gravel pits, and a few landmarks. Test holes are represented by three different symbols. A filled circle (●) represents a location in which sand and/or gravel was encountered in the upper 25 feet with 5 feet or less of overburden. A filled (■) indicates a location at which sand and/or gravel was encountered in the upper 25 feet but the overburden exceeded 5 feet. Numbers accompanying these two symbols refer to table 1 which contains the pertinent information from the test hole log. An unfilled circle (○) indicates a location where no sand and/or gravel was encountered in the upper 25 feet, and are not numbered as they are not listed in the tables.

Gravel pits are designated by a crossed pick and shovel (X). Those with numbers are listed in table 2 and have additional data on file with the District Highway Office of the South Dakota Department of Transportation, Division of Highways in Mitchell, South Dakota. No attempt has been made to differentiate the active from inactive pits.

In addition, the map has been divided into three different area types determined by the probability of finding sand and/or gravel. The probability designations are "good," "fair," or "poor" and have been delineated by use of test hole data, gravel pit locations, topographic maps, aerial photographs, and field observations. Each area listed as "good" or "fair" has been assigned a capital letter (A through I) which are discussed below.

An area designated as "good" contains deposits that are generally (1) fairly thick--12 feet, (2) encompass a large area, and (3) are covered by little overburden, or (4) are very thick but less continuous in lateral extent. Areas A, D, F, and H have been delineated as "good."

Areas A and D in the northwest part of the County are both large outwash deposits in which the thickest sequences of sand and gravel were encountered in the center of the areas. The thickness of overburden in area A averaged less than 3½ feet in

Survey test holes. Area D has a thinner veneer of overburden than area A.

Areas F and H are both part of an outwash deposit in southern Aurora County and northern Charles Mix and Douglas Counties. Area H is much smaller than area F and has been extensively developed. Area F is the most laterally consistent and thickest sand and gravel deposit of those designated as "good." In addition, it contains a wide range of material size, with a relatively thin layer of overburden.

An area designated as "fair" contains deposits that are fairly thick but less really extensive with a greater thickness of overburden. Areas B and C in northeast Aurora County are deposits of alluvium and outwash, much of which has been reworked since initial deposition. Both areas contain excellent sand and/or gravel deposits but have been classified as "fair" due to lack of lateral consistency.

Area I in the southeast corner of the County contains an extremely thick interval of sand and gravel in sections 14 and 23, T. 101 N., R. 63 W. The test holes in this area indicated a deposit more than 20 feet thick with an overburden thickness averaging 1 foot. However, the deposit is relatively small and is extremely thin in the southern section of the area.

Area E in the southwest corner of the County contains sand and gravel of good quality and is locally quite thick but has an average overburden thickness of more than 9 feet.

Area G along the southern border of the County has deposits averaging less than 10 feet thick and has little overburden. A water table of 6 to 9 feet in this area partially submerges most of the thicker deposits.

An area designated as "poor" is composed primarily of till but does contain a few sand or gravel deposits. Some pits within these areas may be very productive but the deposits are localized and difficult to find.

GENERAL SUGGESTIONS FOR EXPLORATORY PURPOSES

It should be emphasized that the map is quite general and to be used as a guideline for further exploration and development of sand and gravel resources. The development of any specific sites would depend upon material specifications for desired use and the economics of developing new sources as compared to using known deposits.

**TABLE 1. List of test holes in Aurora County, South Dakota,
which contain sand and/or gravel in the upper 25 feet**

Lithologic descriptions, as listed, have been condensed from data contained in driller's logs on file at the South Dakota Geological Survey Office, Vermillion, South Dakota, and contain only

information which has been deemed most useful for this study. Water levels, measured in the summer of 1978, may vary with time.

Test hole No.	Location	Lithologic Description	From-to Feet
1	SE NW NW NW 8-105-66	Sand and gravel, fine to coarse Sand, fine, silty	0-22 22-38

TABLE 2. List of sand and gravel pits in Aurora County, South Dakota,
 which are on file at the District Office,
 South Dakota Department of Transportation,
 Division of Highways, Mitchell, South Dakota.

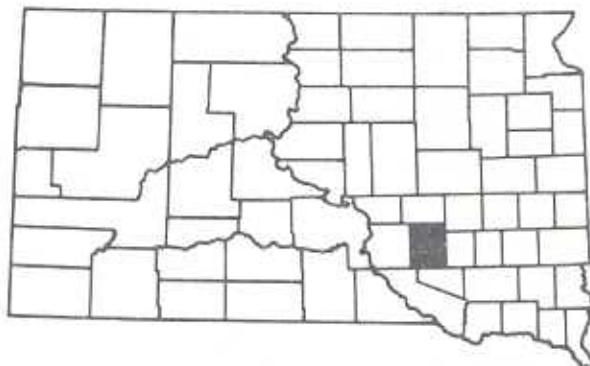

Pit No.	Owner and Address	Location	Type	Average Thickness of Aggregate Deposits (in feet)		Average Overburden Thickness (in feet)
				Average Thickness of Aggregate Deposits (in feet)	Average Overburden Thickness (in feet)	
1	Not listed	NW $\frac{1}{4}$ 8-105-66	Gravel	15.0	1.5	
2	Markhardt, Mark, White Lake	NW $\frac{1}{4}$ 21-105-65	Gravel	6.0	2.4	
3	Markhardt, Mark, White Lake	SE $\frac{1}{4}$ 30-105-65	---	11.4	.9	
4	Schroeder, Herbert, Jr., Wessington Springs	N $\frac{1}{2}$ SW $\frac{1}{4}$ 8-105-63	Gravel	10.6	2.1	
5	Jensen, Elizabeth, Mitchell	SW $\frac{1}{4}$ 8-105-63	Gravel	9.0	2.5	
6	Miles, Elizabeth, White Lake	N $\frac{1}{2}$ 17-105-63	Gravel	10.2	1.7	
7	Scott, Walter, Letcher	SE $\frac{1}{4}$ 17-105-63	Gravel	---	---	
8	Scott, Walter, Letcher	NE $\frac{1}{4}$ 20-105-63	Gravel	8.0	2.0

44	Johnson, Lloyd, Stickney	SW $\frac{1}{4}$ 31-101-63	Gravel	7.3	1.1
45		SW $\frac{1}{4}$ 33-101-63	----	----	----

- Good probability of finding sand or gravel deposits.
- Fair probability of finding sand or gravel deposits.
- Poor probability of finding sand or gravel deposits.

Letters A through I designate areas described in the text.

•¹ Test hole containing sand or gravel in upper 25 feet with 0-5 feet of overburden.
Number refers to Table I.

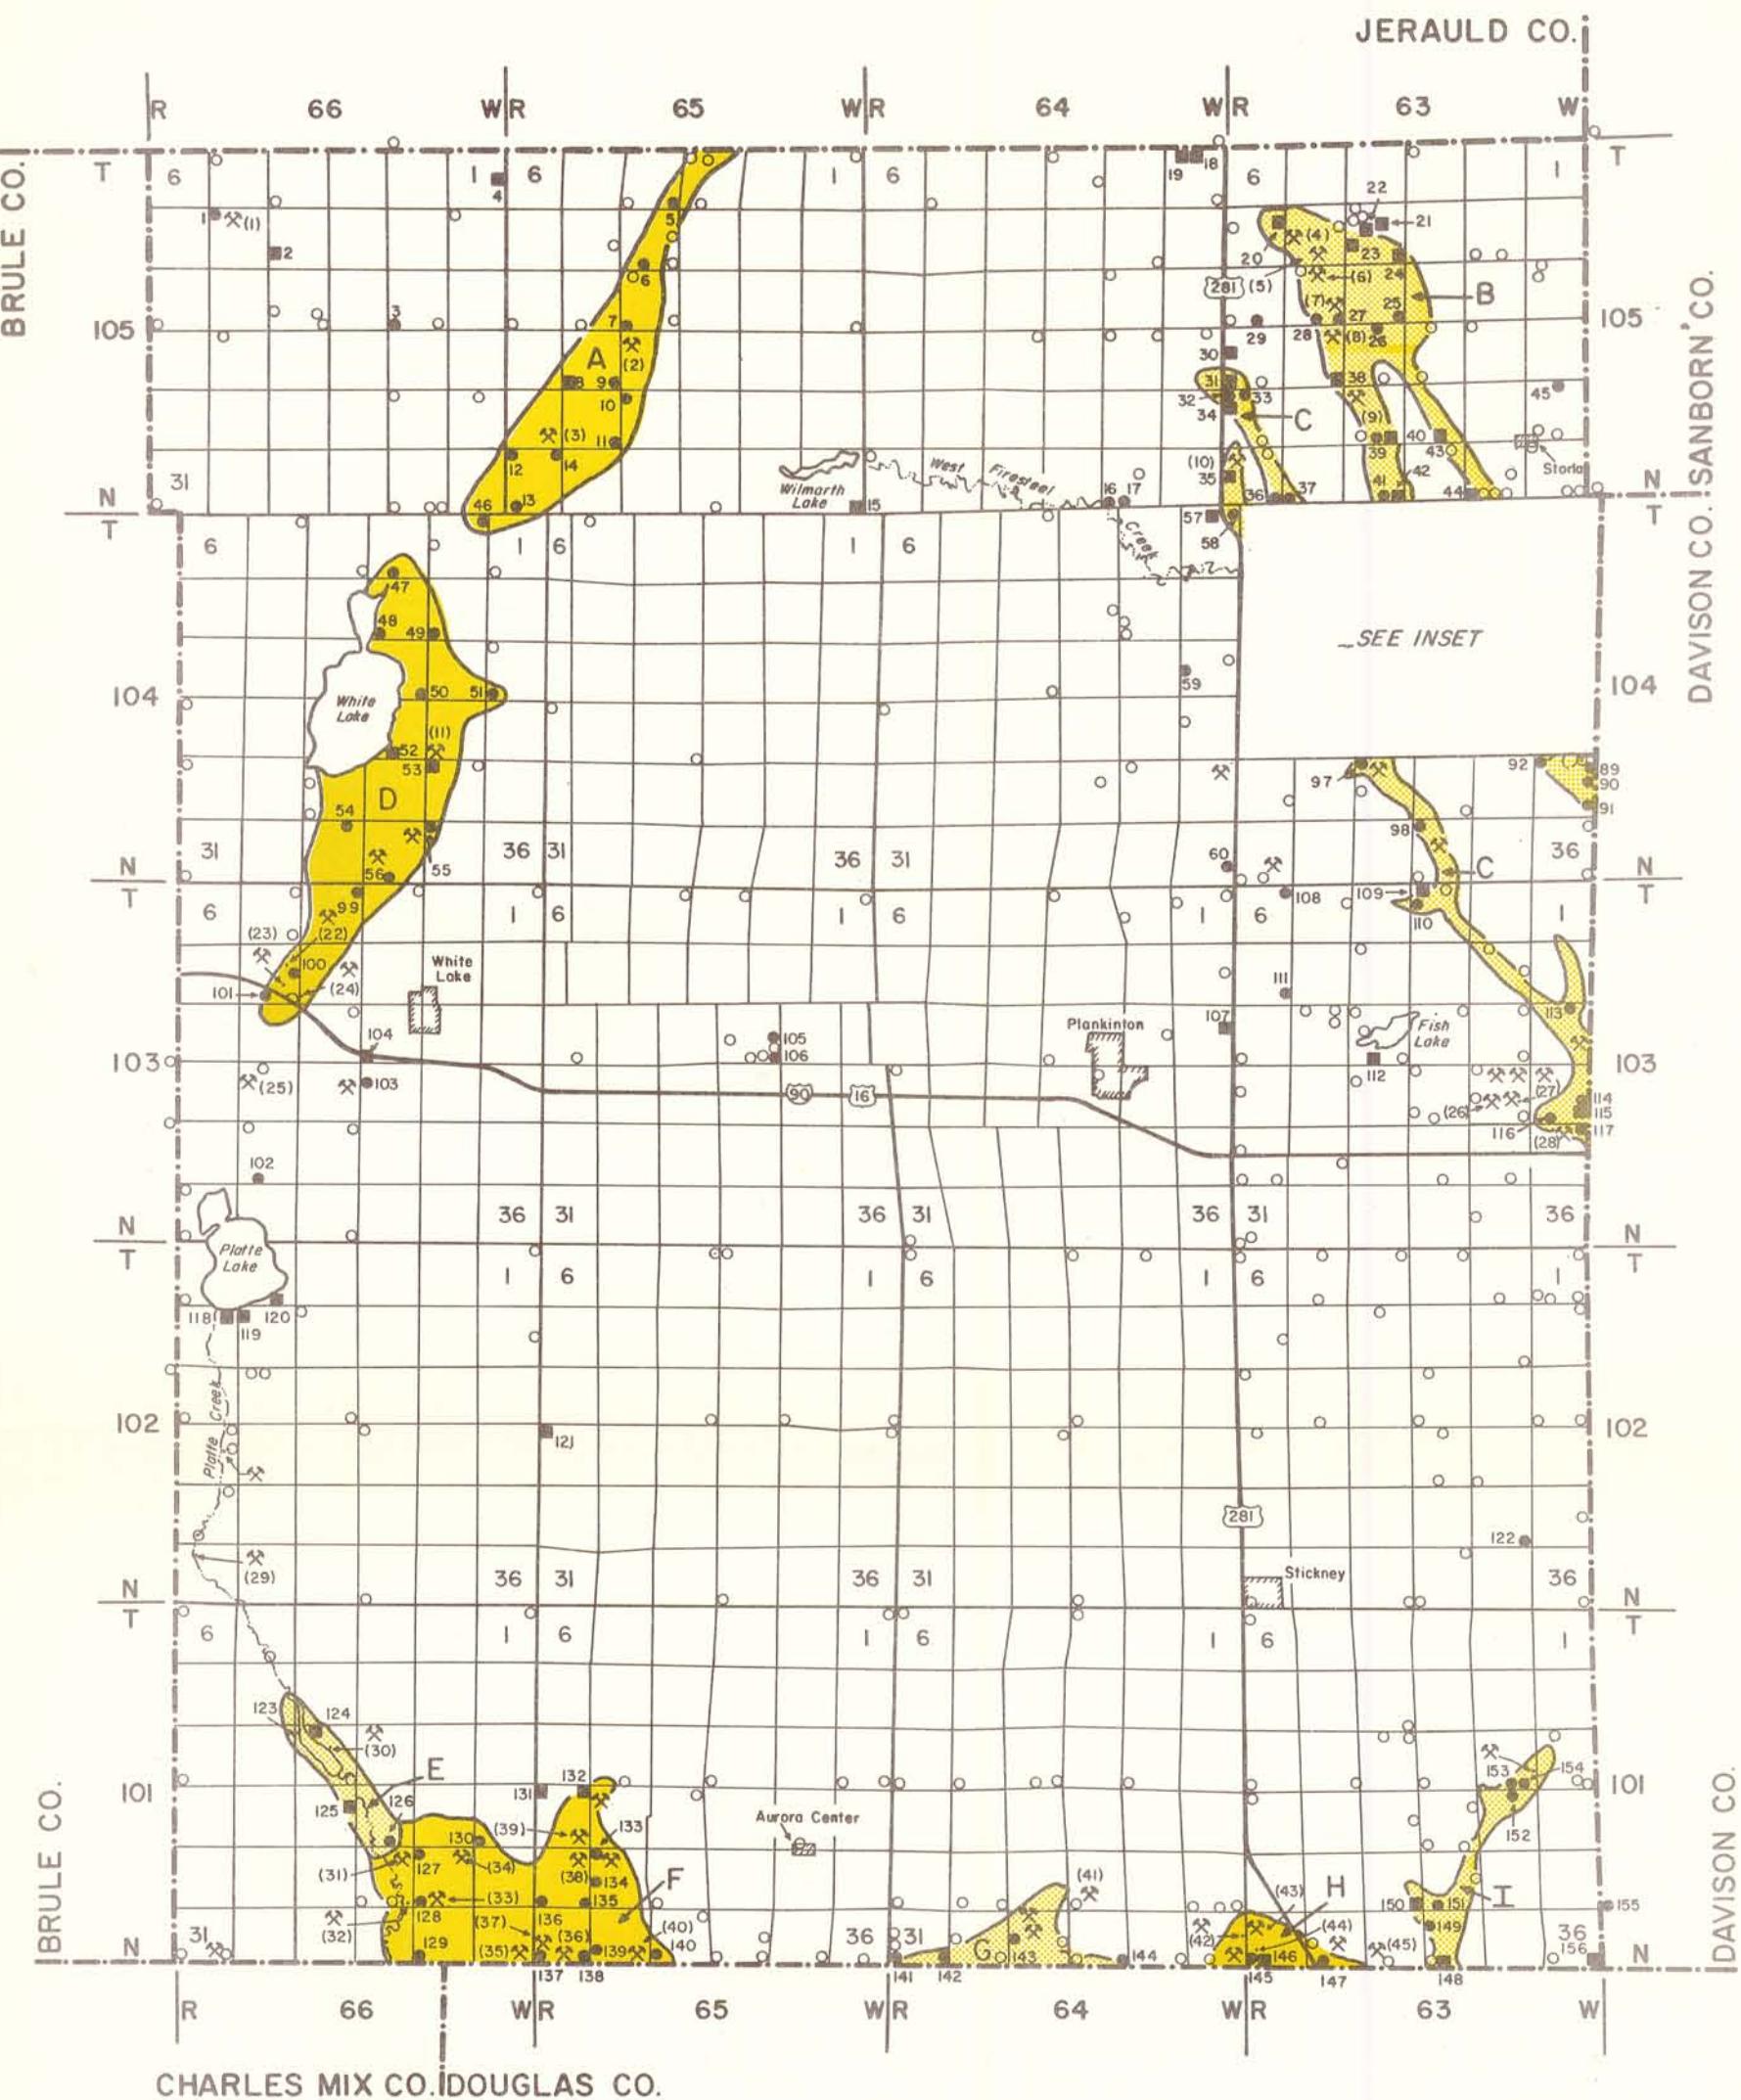

■¹⁵ Test hole containing sand or gravel in upper 25 feet with 6-25 feet of overburden.
Number refers to Table I.

○ Test hole with no sand or gravel in upper 25 feet.

(3) Gravel pit; those numbered are described in Table 2.

Index map showing location of Aurora County.

Mapped by Douglas A. Blaze.
Drafted by E.N. Koglin.

Map showing test holes, gravel pits, and sand and gravel deposits
in Aurora County.
